PSY 111

Introduction to Psychology

COMPLETE MID-TERM EXAM PREPARATION GUIDE

Schools of Thought | History | Methods | Perspectives

What this guide covers:

- Definition & Goals of Psychology
- History & Key Figures
- 7 Schools of Thought
- Research Methods
- Memory Tricks & Examples

Exam Focus Areas:

- Definitions (very likely tested)
- Key founders of each school
- Contributions & Limitations
- Comparing schools to each other

PART 1: WHAT IS PSYCHOLOGY?

PSYCHOLOGY	The scientific study of behavior and mental processes, and how they are affected by an organism's physical state, mental state, and external environment.

The word comes from two Greek roots:

Greek Word	Meaning
Psyche	Soul or Mind
Logos	Word or Study

MEMORY TRICK: PSYCHE + LOGOS = PSYCHOLOGY

"Psyche" = mind/soul. Think: psychiatrist helps your PSYCHE (mind). LOGOS = logic/study. Psychology = the LOGICAL STUDY of the MIND.

Why Study Psychology?

- To scientifically evaluate common beliefs and misconceptions about behavior
- To build a knowledge base of what has already been investigated
- To understand how theoretical developments have evolved through competition of ideas

4 Basic Goals of Scientific Psychology

Goal	Meaning	Example
DESCRIBE	Observe and record behavior	Noting that students study more before exams
EXPLAIN	Find the causes	Anxiety drives students to study more
PREDICT	Forecast future behavior	Students with high anxiety will study longer
CHANGE / CONTROL	Modify behavior	Relaxation techniques reduce exam anxiety

MEMORY TRICK: DEPC

Describe, Explain, Predict, Change. Remember: 'Don't Ever Panic in Class'

PART 2: BRIEF HISTORY OF PSYCHOLOGY

Ancient Roots (Greek Philosophers)

Philosopher	Period	Key Contribution	Label
Plato	5th-4th century BC	Raised psychological questions: What is knowledge? What is love? Mind-body relationship	DUALIST (mind & body separate)
Aristotle	Born 384 BC	First writer in psychology. Studied sensation, memory, sleep. Used term 'psyche' for essence of life	Originator of Psychology
Rene Descartes	1596-1650	Doctrine of innate ideas: we are born with inborn ideas. Continued dualism	DUALIST

Dualism Explained

DUALISM	The idea that the mind and body are SEPARATE. Body = physical, follows laws of nature, can be studied scientifically. Mind = non-physical/spiritual, CANNOT be studied scientifically.

MEMORY TRICK: DUALISM = DUAL (two)

Mind and Body are TWO separate things. Plato and Descartes were both dualists. Remember: D for Dualist, D for Descartes, D for Disconnected.

The Birth of Psychology as a Science

Century	Development
17th century	Psychology emerges from empirical & rational philosophy. Science replaces religion as authority.
18th century	Psychology begins emerging as a science alongside studies of the nervous system
1870s	Psychology becomes a formal area of study when industrial revolution ideas applied to philosophy/physiology
1879	Wilhelm Wundt opens world's FIRST psychology laboratory at University of Leipzig, Germany

Wilhelm Wundt (1832-1920) — Father of Experimental Psychology

- Established the FIRST psychology laboratory at Leipzig in 1879
- Founded the FIRST school of psychological thought: STRUCTURALISM
- Established the first Psychological Journal (1881)
- Published Principles of Physiological Psychology (1874)
- Estimated to have written over 54,000 pages of work
- Used INTROSPECTION as his primary method
- Campaigned to make psychology an independent discipline

EXAMPLE: Wundt measured how long it took a person to detect the sight and sound of a bell being struck — studying mental REACTION TIMES.

G. Stanley Hall (1844-1924)

- Wundt's student who brought psychology to America
- Founded the American Psychological Association (APA) — and became its FIRST president
- Started America's first research laboratory at Johns Hopkins University (1883)
- Began the first psychology journal in America

MEMORY TRICK: Hall = APA Hall of Fame

G. Stanley Hall — think of him as the 'Hall' that connects European (Wundt) to American psychology.

PART 3: SCHOOLS OF THOUGHT IN PSYCHOLOGY

There are 7 major schools of thought you must know:

#	School	Key Figure(s)	Core Focus
1	**STRUCTURALISM**	Wundt, Titchener	Break mind into basic elements (sensations, feelings, images)
2	**FUNCTIONALISM**	William James	PURPOSE of consciousness; how mind helps us adapt
3	**BEHAVIORISM**	Watson, Skinner, Pavlov	Only observable behavior (S-R psychology). Rejected consciousness.
4	**GESTALT**	Max Wertheimer, Koffka, Kohler, Lewin	The WHOLE is greater than the sum of its parts. Perception & insight.
5	**HUMANISM**	Carl Rogers, Abraham Maslow	Free will, personal growth, self-concept, unique human potential
6	**PSYCHOANALYTIC**	Sigmund Freud	Unconscious conflicts drive behavior. Id, Ego, Superego. Dreams & free association.
7	**COGNITIVISM**	Jean Piaget & others	Behavior driven by thoughts, perception, memory, and thinking

MEMORY TRICK: S-F-B-G-H-P-C

Schools in order: 'Smart Frogs Behave Genuinely, Helping People Connect' Structuralism - Functionalism - Behaviorism - Gestalt - Humanism - Psychoanalytic - Cognitivism

1. STRUCTURALISM — The First School

STRUCTURALISM	The FIRST school of psychology. Focuses on breaking down mental processes into the most basic components (elements). Method: INTROSPECTION.

Aspect	Detail
Founder	Wilhelm Wundt (Father of Structuralism)
Key Figure	Edward Titchener (1867-1927) — led structuralist movement
Others	Weber, Fechner
Method	INTROSPECTION — careful, systematic self-observation of conscious experience
Main Elements	Sensations, Feelings, Images
Belief	Psychological wholes are compounds of elements
Year Founded	1879 (Wundt's Leipzig lab)

Contributions of Structuralism

- Separated psychology from philosophy and made it an independent discipline
- Emphasized systematic observation of mental activities under controlled conditions
- Provided an experimental method for studying human behavior (experimental introspection)
- Initiated a spirit of science and experimentation in the field of education

Limitations of Structuralism

- Introspection is unreliable, limiting, and SUBJECTIVE
- Based on internal behavior which cannot be observed directly
- Cannot be used to study children, mentally defective persons, or animals

EXAMPLE: Introspection in practice: A trained subject would describe their exact mental experience when tasting sugar — 'I notice a sweet sensation, followed by a pleasant feeling of warmth.' This is structuralism in action.

¡ MEMORY TRICK: STRUCTURE = Breaking into PARTS

Structuralism = like analyzing a building's STRUCTURE brick by brick. Wundt breaks consciousness into tiny 'bricks' (sensations, feelings). Method = INTROSPECTION (looking INWARD).

2. FUNCTIONALISM — The Second School

FUNCTIONALISM	The SECOND school. Focuses on the FUNCTION or PURPOSE of consciousness and behavior — how the mind helps us ADAPT to our environment. Reaction AGAINST structuralism.

Aspect	Detail
Founder / Key Figure	William James (1842-1910) — Father of American Psychology
Chicago Functionalists	John Dewey, Angell, Harvey Carr
Columbia Functionalists	Thorndike, Cattell, Woodworth
Key Book	Principles of Psychology (1890) — standard psych textbook
Influence	Charles Darwin's theory of natural selection
Focus	HOW and WHY the mind functions; practical applications
Flourished at	Universities of Chicago and Columbia, USA

Tenets of Functionalism

- Studies mind as it functions in ADAPTING the individual to their environment
- Mind and body are intrinsically ONE (opposite of dualism)
- Mental activities are the result of adjustment between mind and body
- Psychology aims to study what FOR and what OF mental processes

Contributions to Education

- Included curriculum with subjects having practical utility
- Emphasized study of various problems of the learner and their solution
- Gave importance to learning by doing — developed activity-oriented methods (project method)
- Emphasized child-centered learning

Limitations of Functionalism

- The term 'function' is used inconsistently — failed to define many psychological concepts
- It is teleological (holds that mind functions to achieve some purpose) and eclectic
- Like structuralists, also focused only on consciousness and neglected the unconscious
- Neglected socio-cultural influences in the functioning of mind

MEMORY TRICK: FUNCTION = PURPOSE = DARWIN

Functionalism asks 'what is the FUNCTION of this behavior?' Like Darwin asked 'what is the FUNCTION of this animal's trait?' William James = Functionalism. Both care about SURVIVAL and ADAPTATION.

Structuralism vs. Functionalism — Direct Comparison

Feature	STRUCTURALISM	FUNCTIONALISM
Founder	Wundt / Titchener	William James
Key Question	WHAT is the mind made of?	WHY and HOW does the mind work?
Focus	Elements / Structure of consciousness	Purpose / Adaptation of consciousness
Method	Introspection in labs	Broader methods, practical settings
Common Ground	Both study human consciousness	Both study human consciousness
Reaction	First school	Counter-argument to Structuralism
Part of	Experimental psychology	Counter to experimental psych

3. BEHAVIORISM — The Dominant School

BEHAVIORISM	Psychology should ONLY study observable, measurable behavior. Consciousness is ABANDONED. Behavior = response to stimulus. Founded as a PROTEST against structuralism and functionalism.

Aspect	Detail
Founder	John B. Watson (1913)
Major Contributors	B.F. Skinner, Ivan Pavlov, Tolman, Hull
Peak Influence	1950s — became DOMINANT school
Core Concept	Stimulus (S) → Response (R) — S-R Psychology
Key Debate Sparked	Nature vs. Nurture
Famous Work	Skinner: 'Beyond Freedom and Dignity'

Key Definitions

BEHAVIOUR	Any overt and observable response or activity by an organism.

STIMULUS	Any detectable input from the environment.

Tenets of Behaviorism

- Psychology is the science of stimulus and response (S-R)
- Concerned with receptors (sense-organs) and effectors (muscles and nerves)
- Chief task: study overt/observable behavior that can be measured scientifically
- Behavior = merely a response to environmental stimulus
- Environmental forces shape personality and behavior
- All behavior is learned through interaction with environment

B.F. Skinner's Contribution

- Voted the MOST IMPORTANT influence in the history of psychology
- Discovered: organisms repeat responses that lead to POSITIVE outcomes (reinforcement)
- Found: organisms do NOT repeat responses leading to negative outcomes
- This formed the foundation of BEHAVIOUR MODIFICATION in schools, prisons, hospitals

EXAMPLE: Skinner used stimulus-response pairings to control rats and pigeons with remarkable consistency. If a rat presses a lever and gets food, it will keep pressing. If pressing the lever gives an electric shock, the rat will stop. This is operant conditioning.

Contributions to Education

- Advocated use of REINFORCEMENT in place of punishment

- Developed programmed learning
- Techniques of shaping behaviour and behaviour modification
- Contributed to dealing with difficult/maladjusted children in classrooms

Limitations of Behaviorism

- Human behavior is too complex to study by breaking down into simple S-R connections
- Focused totally on OBSERVABLE behavior and neglected covert (hidden) behavior
- Gave importance to environment and neglected the role of HEREDITY

MEMORY TRICK: WATSON = WATCH behavior only

Behaviorism = only what you can WATCH and measure. Watson said: 'I don't care about your mind — show me your BEHAVIOR!' Remember: Stimulus leads to Response. S-R = See-React.

4. GESTALT PSYCHOLOGY — The Whole Picture

GESTALT	German word meaning 'configuration' or 'organised whole.' The WHOLE is greater than the sum of its parts. Emphasizes perception, insight, and organization.

Aspect	Detail
Founder	Max Wertheimer
Key Figures	Kurt Koffka, Wolfgang Kohler, Kurt Lewin
Origin	Born in Germany
Core Principle	The whole determines the behavior of its parts
Method	Studying organized patterns of perception

Tenets of Gestalt Psychology

- The whole is GREATER than the sum of its parts
- An individual perceives a thing as a WHOLE, not a collection of elements
- Perception always involves a problem of ORGANIZATION
- Learning takes place as a result of organization of the perceptual field in a meaningful and intelligent way
- Gestalt psychologists emphasized INSIGHT in learning — sudden understanding

EXAMPLE: Look at this word: GESTALT. You immediately read it as a whole word, not as individual letters G-E-S-T-A-L-T. Also, when you see a partly drawn circle, your brain 'closes' the gap — this is the Gestalt principle of CLOSURE.

Gestalt Perception Principles

Principle	Meaning
Figure-Ground	We separate objects from their background (e.g., seeing a face, not just colors)
Proximity	Objects close together are perceived as a group
Continuity	We perceive smooth, continuous patterns rather than disconnected ones
Closure	We mentally 'close' incomplete shapes to see them as wholes
Similarity	Similar objects are grouped together
Common Region	Objects in the same bounded area are perceived as belonging together

Contributions to Education

- Emphasized presenting subject matter as a WHOLE to make learning more meaningful

- Gestalt principles applied to construction of curriculum, syllabus, work plans
- Holistic methods of teaching, holistic evaluation, insight learning
- Interdisciplinary approach to study of problems
- Learning of generalizations/laws enables students to apply knowledge to new situations

Limitations of Gestaltism

- Failed to explain learning beyond perceptual experience
- Failed to explain how behavior is strengthened through practice
- Could not fully explain how previous experience influences learning
- Could not explain trial-and-error learning

MEMORY TRICK: GESTALT = THE BIG PICTURE

Gestalt says: 'Don't miss the forest for the trees.' The WHOLE forest matters, not individual trees. Famous phrase: 'The whole is GREATER than the sum of its parts.' Founder = Max Wertheimer (Germany).

5. PSYCHOANALYSIS — The Unconscious Mind

PSYCHOANALYSIS	Founded by Sigmund Freud. Studies human behavior through analysis of UNCONSCIOUS mental processes. Uses free association and dream analysis to explore the hidden mind.

Aspect	Detail
Founder	Sigmund Freud (Viennese neurologist)
Key Contributors	Adler, Jung, Hartmann, Erickson, Anna Freud
Methods Used	Free association, dream interpretation/analysis
Core Belief	Unconscious conflicts determine behavior and personality

The Three Levels of Mind

Level	% of Mind	Description
CONSCIOUS	10%	Thoughts, feelings, perceptions you are AWARE of right now
SUBCONSCIOUS (Preconscious)	50-60%	Memories and knowledge you can bring to consciousness when needed
UNCONSCIOUS	30-40%	Hidden repressed wishes, desires, feelings, drives, motives — NOT accessible

Freud's Personality Structure (Id, Ego, Superego)

Component	Description	Analogy
ID	Instinctive desires — 'I want it NOW!' Pleasure principle.	The Hungry Child
EGO	Reason based on real experience. The rational mediator. Reality principle.	The Wise Parent
SUPEREGO	Moral inhibition — conscience, guilt. 'You should NOT do that!'	The Strict Judge

EXAMPLE: You smell a freshly baked cake in a shop. ID says: 'Steal it! Eat it now!' SUPEREGO says: 'That's wrong, don't steal!' EGO says: 'Let's buy it properly.' The ego mediates between your desires and moral code.

Key Concepts

- Unconscious glimpses revealed in: dreams, memory blocks, slips of tongue (Freudian slips), humor

- Psychological disorders result when unconscious conflicts become extreme
- Core of personality laid down in CHILDHOOD
- Human behavior = result of adaptation to physical and social world

Contributions to Education

- Freud discovered unconscious motivation which plays important role in learning
- Emphasized importance of early childhood experiences in education
- Stressed importance of feelings and emotions in the process of education
- Threw light on causes of maladjustment and behavioral problems in children

Limitations of Psychoanalysis

- Freudian concepts (id, ego, superego) are hypothetical constructs lacking scientific support
- Overemphasized sexual world and neglected social experience in personality formation
- Does not permit inferences about cause and effect
- Freud adopted non-scientific methods

MEMORY TRICK: FREUD = UNDERGROUND mind

Freud's unconscious is like an ICEBERG — only 10% is visible above water. The MASSIVE part (unconscious) is hidden below. Freud digs into what is HIDDEN using dreams and free association.

6. HUMANISM — The Free Will Movement

HUMANISM	Emphasizes the unique qualities of humans, personal freedom, personal growth, and free will. A DIRECT REACTION against both behaviorism and psychoanalytic theory which stripped free will.

Aspect	Detail
Key Figures	Carl Rogers & Abraham Maslow
Core Belief	Human behavior determined by individual's SELF-CONCEPT
Distinguishing Factor	Only humans have self-concept (animals presumably lack it)
Focus	Self-determination, free will, unique human potential
Reaction to	Behaviorism (environment controls us) and Freudianism (unconscious controls us)

Key Tenets

- Each person has unique potential for psychological growth and self-direction
- Self-determination and FREE WILL are central to psychological growth
- Human behavior predicted by culture, values, language, development, and attitudes — NOT deterministic laws
- Each self-concept seeks to grow, evolve and develop
- Psychological disturbances arise when these growth drives are BLOCKED

EXAMPLE: A student who believes 'I am a capable person' (positive self-concept) will approach challenges with confidence and grow. A student with a negative self-concept may avoid challenges. Humanists would help that student rebuild their self-concept.

MEMORY TRICK: HUMANISM = HUMAN FREE WILL

Humanists say: 'You are NOT just a programmed robot (Behaviorism) or a slave to your unconscious (Freud) — you have FREE WILL and can GROW!' Rogers = self-concept. Maslow = hierarchy of needs.

7. COGNITIVISM — The Thinking School

COGNITIVISM	Behaviors are performed because of IDEAS and THOUGHTS. Focuses on internal mental processes: perception, memory, thinking. Currently the most influential school in psychology.

Aspect	Detail
Focus	Perception, memory, thinking, problem-solving
Belief	Behavior is driven by internal cognitive processes
Status	Currently exerts STRONG influence in psychology

MEMORY TRICK: COGNITIVISM = THINKING

COGNITIVE = related to COGNITION = THINKING. Cognitivism says behavior starts in the MIND — your thoughts drive your actions. Think: 'COG' like a cog in a thinking machine.

PART 4: OTHER PSYCHOLOGICAL PERSPECTIVES

Additional Perspectives from the Lecture Notes

Perspective	Focus	Key Idea
Biopsychological	Biological factors & mental processes	How the brain/biology affects behavior. Includes psychopharmacology, development, genetics.
Social Psychological	Interpersonal behavior & social forces	Attitude formation, prejudice, conformity, attraction, aggression, group behavior
Evolutionary	Evolution principles applied to psychology	Based on Darwin's natural selection. Behaviors that aid survival are passed on.

Darwin's Theory of Natural Selection

- Wrote On the Origin of Species by Means of Natural Selection (1859)
- Natural selection: organisms better adapted to environment survive and reproduce more
- 4 Components: Variation, Inheritance, High rate of population growth, Differential survival and reproduction
- Species change over time; all organisms share common ancestors
- Evolutionary change is gradual and slow

EXAMPLE: Functionalists like William James applied Darwin to humans: traits (including mental ones) that help us ADAPT and SURVIVE are 'selected' over time. Fear response = survival tool.

PART 5: PSYCHOLOGY AS A SCIENCE

The Scientific Method

SCIENTIFIC METHOD	Systematic procedure of observing and measuring phenomena to answer questions about: What happens, When it happens, What causes it, and Why.

Step	Action	Example
1	Formulate a research question	Does low self-image cause depression?
2	State the hypothesis	People with poorer self-images score higher on a depression scale
3	Test the hypothesis	Subjects respond to statements like 'I'm fun to be with' / 'I have good ideas'
4	Draw conclusions based on findings	Results support/reject the hypothesis
5	Publish research	Share findings in a journal
6	Replicate study	Other researchers repeat the study to verify

Research Methods in Psychology

Type	Method	Key Feature
EXPERIMENTAL	Laboratory, Field, Quasi-experiment	Produces measurable quantitative data; can show CAUSE AND EFFECT
NON-EXPERIMENTAL	Observation, Survey, Interview, Case Study	Often descriptive or qualitative; CANNOT show causation

Key Research Concepts

INDEPENDENT VARIABLE (IV)	The variable that is manipulated by the experimenter — the INPUT variable.

DEPENDENT VARIABLE (DV)	The OUTCOME variable — what the experimenter measures to see if it was affected by the IV.

CONTROL GROUP	Participants randomly assigned who do NOT receive the treatment. Used as comparison.

EXPERIMENTAL GROUP	Participants who DO receive the treatment. Their scores are compared to the control group.
CORRELATIONAL STUDY	Determines if a relationship exists between variables, its direction, and strength. CANNOT prove causation.
NATURALISTIC OBSERVATION	Observing behavior in its NATURAL environment. Simplest form of research.

EXAMPLE: Experiment: Does caffeine improve test scores? IV = caffeine (given or not given). DV = test score. Experimental group = drinks caffeine. Control group = drinks water. If the caffeine group scores higher, caffeine may have caused improvement.

MEMORY TRICK: IV causes DV

INDEPENDENT Variable = what you CHANGE. DEPENDENT Variable = what you MEASURE (it DEPENDS on the IV). Easy trick: 'I change the Independent; I measure the Dependent.'

Scientific Thinking in Psychology — 10 Elements

#	Element	What it means
1	Critical Thinking	Assess claims based on evidence, not emotion or anecdote
2	Asking Questions	WHY? HOW? WHAT? — the core of inquiry
3	Defining Terms	Terms must be clear and concrete
4	Examining Evidence	Personal opinion doesn't count — show the evidence
5	Analyzing Assumptions & Biases	Scientific thinkers work hard to overcome their own biases
6	Avoiding Emotional Reasoning	Don't let gut feelings replace clear thinking
7	Avoiding Oversimplification	The obvious answer is often wrong; don't argue by anecdote
8	Considering Other Interpretations	Best interpretations are supported by most evidence
9	Tolerating Uncertainty	Sometimes evidence is unclear or doesn't exist
10	Asking Testable Questions	Questions must be testable in the real world

PART 6: ETHICS IN PSYCHOLOGY

Ethical Standards in Research

Ethical issues are handled by the ethical review committee and ethical standards boards. Their main aim is to promote:

- Individual dignity
- Human welfare
- Scientific integrity

Core Ethical Principles (5 Key Points)

Principle	Meaning
No Harm	Ensure no physical or psychological harm comes to subjects
Informed Consent	Participants must agree to participate knowing what is involved
Confidentiality	Personal data of participants must be kept private
Deception	If deception is used (rarely), it must be justified and minimal
Debriefing	After the study, participants must be fully informed about the true nature of research

PART 7: QUICK REVISION — EXAM CHEAT SHEET

FIRSTS in Psychology — Highly Exam-Worthy

What	Who / When
First known writer in psychology	Aristotle (384 BC)
First psychology laboratory	Wilhelm Wundt — Leipzig, Germany (1879)
First psychology journal	Wilhelm Wundt (1881)
First school of psychological thought	Structuralism — by Wundt
Father of Experimental Psychology	Wilhelm Wundt
Father of American Psychology	William James
First American psychology lab	G. Stanley Hall — Johns Hopkins University (1883)
First American psychology journal	G. Stanley Hall
First president of APA	G. Stanley Hall
Founded APA	G. Stanley Hall
First psychology textbook	William James — Principles of Psychology (1890)
Founded Behaviorism	John B. Watson (1913)
Most important influence in psych history	B.F. Skinner (voted)
Founded Gestalt Psychology	Max Wertheimer (Germany)
Founded Psychoanalysis	Sigmund Freud
Championed Humanism	Carl Rogers & Abraham Maslow

Key Terms Glossary

Term	Definition
Introspection	Careful, systematic self-observation of one's own conscious experience
Empirical Evidence	Information based on direct observation and measurement using scientific method
Dualism	The idea that mind and body are separate entities
Natural Selection	Process where organisms better adapted to environment survive and reproduce more
Stimulus	Any detectable input from the environment
Behavior	Any overt and observable response or activity by an organism
Reinforcement	A consequence that increases the likelihood of a behavior being repeated
Self-Concept	An individual's perception of themselves —

	central to humanistic psychology
Gestalt	German word meaning 'configuration' or 'organised whole'
Psyche	Greek word meaning soul or mind — root of 'psychology'
Logos	Greek word meaning word or study — root of 'psychology'

Schools: Contributions vs. Limitations Summary

School	Main Contribution	Main Limitation
Structuralism	Made psychology independent; experimental introspection	Introspection is subjective; can't study animals/children
Functionalism	Practical applications; child-centered education; activity learning	Neglected unconscious; failed to define key concepts well
Behaviorism	Reinforcement theory; behaviour modification; programmed learning	Ignored internal/covert behavior; neglected heredity
Gestalt	Holistic learning; insight learning; curriculum organization	Failed to explain trial-and-error; previous experience
Psychoanalysis	Unconscious motivation; role of early childhood; emotions in learning	Non-scientific; over-emphasized sexuality; hypothetical constructs
Humanism	Recognized free will; personal growth; self-concept	Difficult to test scientifically; vague concepts
Cognitivism	Currently dominant; explains thinking/memory/perception	Still developing; can overlook emotional/social factors

MEMORY TRICK: FINAL MEGA TRICK

Schools timeline: WUNDT (1879) starts with Structuralism. JAMES answers with Functionalism. WATSON rebels with Behaviorism (1913). WERTHEIMER proposes Gestalt in Germany. FREUD digs the Unconscious. ROGERS/MASLOW restore Free Will. COGNITIVISM rules today.

Good Luck on Your Mid-Term Exam!

You've got this — you've studied everything!
